### Third and Fourth Cases of West Nile Virus Mosquito Samples Found in County

**Carlisle, PA** – Pennsylvania Department of Environmental Protection (DEP), today notified Cumberland County’s Vector Control Office of two additional positive mosquito samples for West Nile Virus (WNV). The positive samples were collected in Lemoyne Borough and East Pennsboro Township. Currently there have been four positive results in the county for 2023.

Residents can help prevent the spread of WNV by:

- Using mosquito repellants and wearing long-sleeved shirts and pants
- Taking extra precautions around dusk, the peak of female mosquito feeding
- Securing window and door screens to prevent mosquitos from entering your home
- Dumping stagnate water around your property
- Treating water sources that cannot be drained with mosquito dunks that contain *Bacillus thuringiensis israelensis* (Bti), which kill larvae. These products are safe for use around humans and pets; and can be found at hardware stores and other local retailers.

Mosquitos are infected with WNV when feeding on infected birds. They transmit the disease to other birds, animals, and humans.

The county’s WNV program utilizes an Integrated Pest Management (IPM) Plan which controls mosquitoes, while limiting health risks and protecting the environment. Vector Control continues to collect, monitor, and treat water habitats.

The virus is not spread person-to-person. One in five people infected with West Nile Fever develop mild symptoms including aches, fever, skin rash and swollen lymph nodes. With rest and fluids, most people recover in a few days. Less than one percent of infections develop into the life-threatening West Nile Encephalitis. Severe case symptoms include a high fever, headache, neck stiffness, muscle weakness, disorientation, tremors, and convulsions. This infection requires immediate medical treatment.
